

PILLOW

LEV2050 has developed **PILLOW**, a unique and novel product, with **patent application P202030522**, which consists of a **treatment system to prevent reductions**, in a preventive or curative way, and which ensures that **0 of the compounds added** for such purpose are left behind.

The product is presented in **“tea” bags**, as an infusion, **to retain the adsorbent compounds that trap sulphur substances** inside.

The compounds used in this novel system have been **polymers consisting of polysaccharides and compounds of mineral origin** admitted in Regulation (EU) 2019/934.

These **“tea” bags go inside a net**, which will be able to contain the units of bags necessary for the treatments, **in the pre-fermentation process or in the post-fermentation process** (finished wine).

How to use:

Deposit the necessary bags on the net, put them in the wine tank, and let act 5 days minimum.

This net can go inside a stainless-steel receptacle with holes, or tied to the bottom mouth of the tank, always in a position that favours easy handling to remove the net from the tank once the process is finished.

Format

The product is presented in a box with 10 bags for treatment of 10,000 liters.

Conservation

Store in a dry environment, without odours and at room temperature.
